Introduction

Power BI is a Data Visualization and Business Intelligence tool that converts data from different data sources to interactive dashboards and BI reports. Power BI suite provides multiple software, connector, and services - Power BI desktop, Power BI service based on SaaS, and mobile Power BI apps available for different platforms. These set of services are used by business users to consume data and build BI reports.

Power BI desktop app is used to create reports, while Power BI Services (Software as a Service - SaaS) is used to publish the reports, and Power BI mobile app is used to view the reports and dashboards.

Power BI Desktop is available in both 32-bit and 64-bit versions. To download the latest version, you can use the following link –

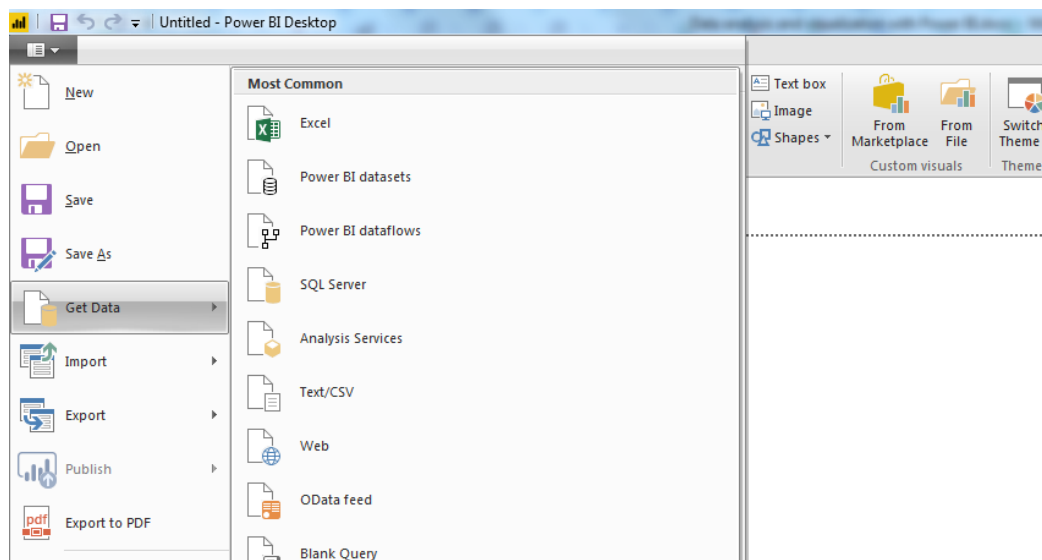

<https://powerbi.microsoft.com/en-us/downloads/>

Task 1. Data import

In this exercise, we import data from Excel to Power BI desktop. Please, follow the screenshots

From the top menu choose “Get Data” -> Excel

Open the file: Sample Dataset Cars.xlsx

Choose “Cars” worksheet (you will see the preview of the worksheet) and click “Load”.

Navigator

Display Options ▾

Sample Dataset Cars.xlsx [2]

☒ Cars

☐ Car_sales

Cars

Manufacturer	Model	Sales_in_thousands	__year_resale_value	Vel
Acura	Integra	16.919	16.36	
Acura	TL	39.384	19.875	
Acura	CL	14.114	18.225	
Acura	RL	8.588	29.725	
Audi	A4	20.397	22.255	
Audi	A6	18.78	23.555	
Audi	A8	1.38	39	
BMW	323i	19.747	null	
BMW	328i	9.231	28.675	
BMW	528i	17.527	36.125	
Buick	Century	91.561	12.475	

To see your data imported choose the icon on the left side of the screen.

Untitled - Power BI Desktop

Paste Copy Format Painter Get Data Recent Sources Enter Data Edit Queries Refresh New Page New Visual Ask A Question

Clipboard External data Insert

Manufacturer Model Sales_in_thousands __year_resale_value Vehicle_type

Acura	Integra	16.919	16.36	Passenger
Acura	TL	39.384	19.875	Passenger
Acura	CL	14.114	18.225	Passenger
Acura	RL	8.588	29.725	Passenger
Audi	A4	20.397	22.255	Passenger
Audi	A6	18.78	23.555	Passenger
Audi	A8	1.38	39	Passenger
BMW	323i	19.747		Passenger

Task 2. Data preparation

Task 2.1. Setting data types

Data preparation is the act of manipulating (or pre-processing) raw data into a form that can readily and accurately be analyzed.

On the right side of the screen there is a data structure of the table “Cars”. Some of the data fields are marked with the symbol Σ. This means that the field is treated as number (other fields can be text or date).

FIELDS

Search

Cars

__year_resale_value
Curb_weight
Engine_size
Fuel_capacity
Σ Fuel_efficiency
Σ Horsepower
▶ Latest_Launch
Length
Manufacturer
Model
Power_perf_factor
Price_in_thousands
Sales_in_thousands

We need to change the type of some fields that should be numbers, these are:

- Year_resale_value
- Curb_weight
- Engine_size
- Fuel_capacity
- Length
- Price_in_thousands
- Sales_in_thousands
- Width

To change the type of the fields, click the icon of three dots, and choose “Edit query”

This will switch to the edit mode, where you can change the types of the fields.

Choose the ribbon “Transform”, where you can find the options of changing field type.

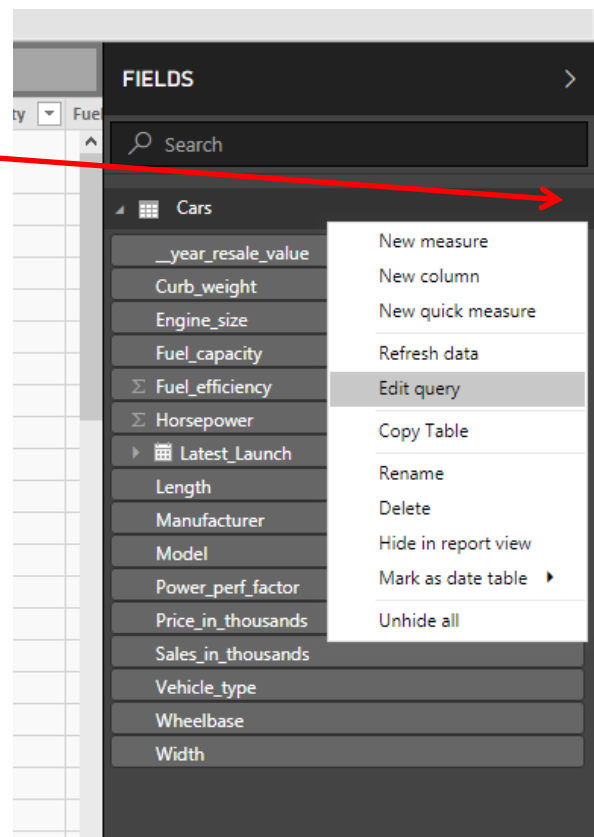

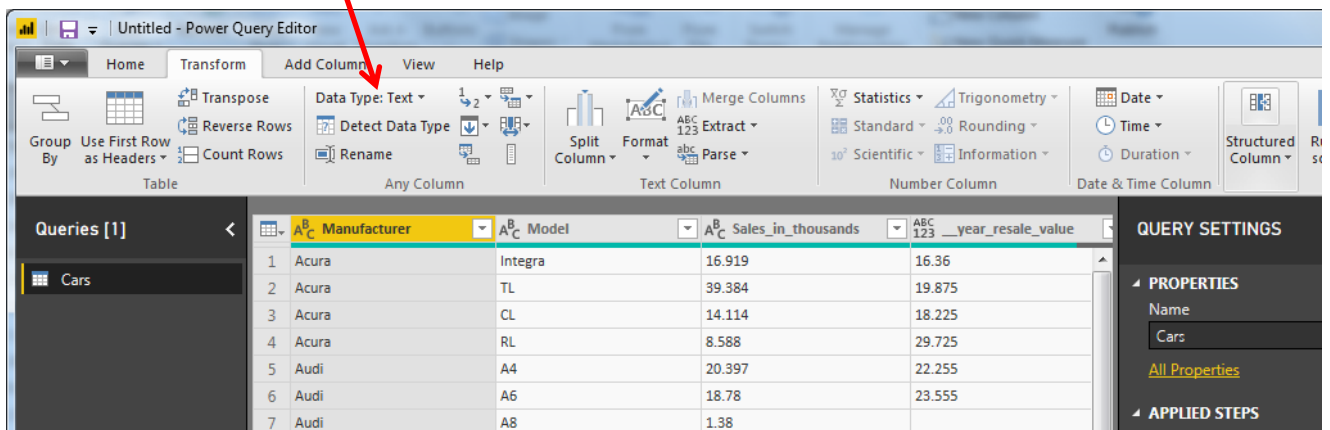

Figure List of fields in the table

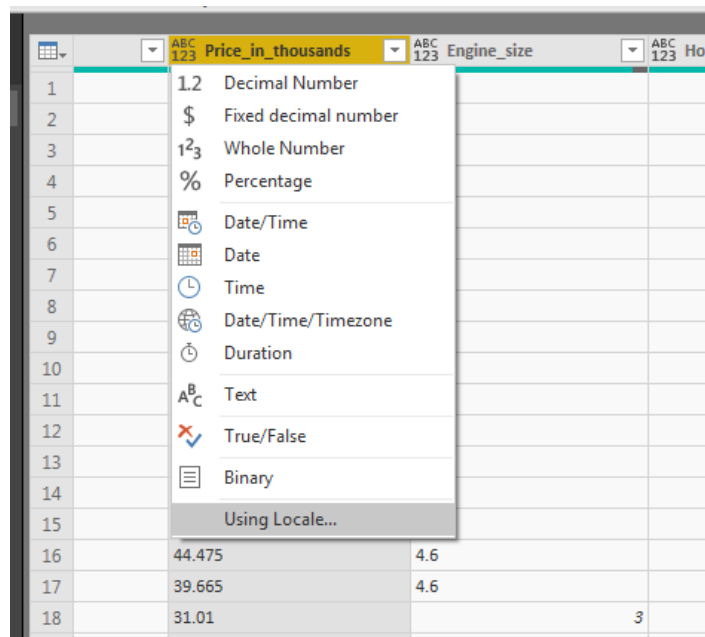

Click on the column header to select data type from the drop-down menu. For the fields that should be in currency format choose “Using Locale..” option. Choose “English United States”

Do the same for other fields that should be in currency format.

For other fields choose accordingly Decimal Number or Whole Number.

The errors can appear depending on your system local settings (dot or comma as decimal separator).

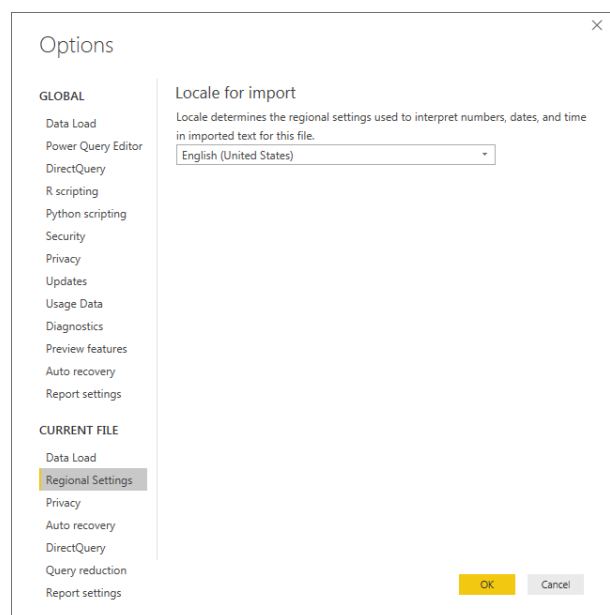

In the case of errors, go to Options and Settings (the button on the left top corner of the screen)

Change the regional settings to “English (United States)”

When you set the correct type for all the fields, click Close and Apply button (left top of the screen).

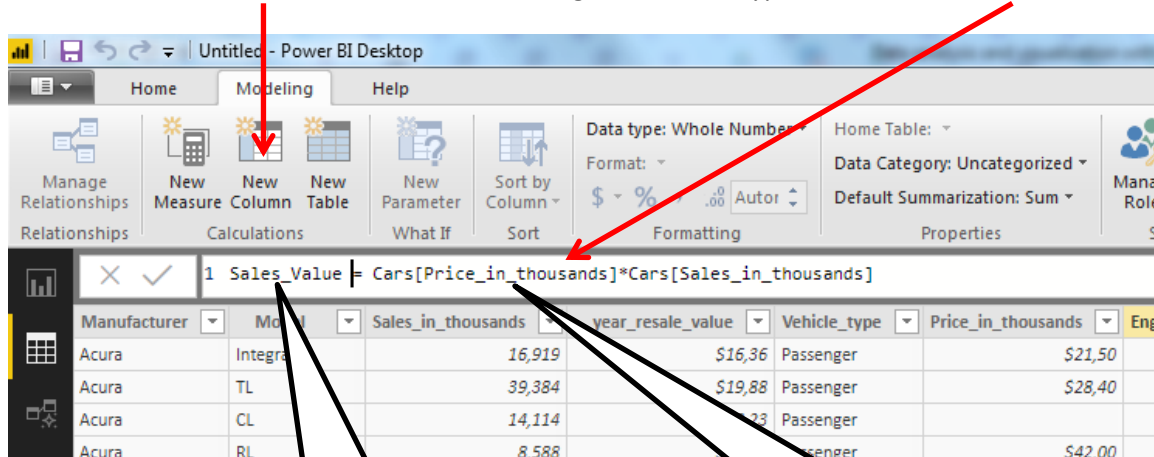

If the wrong currency symbol is displayed you can change it in Modelling Tab.

Task 2.2. Adding calculated columns

In our example of sales analysis of cars there is no column with sales value (which could be useful in reports and visualization). But we can easily add the new column it by multiplying the price and the number of cars sold.

To do this click “New Column” on the “Modeling” ribbon and type in the formula bar:

Change the default name
Column on Sales_Value

Prompts will be shown while typing
so you can just start writing and
choose the field name 😊

Manufacturer	Model	Sales_in_thousands	year_resale_value	Vehicle_type	Price_in_thousands	Sales_Value
Acura	Integra	16,919	\$16,36	Passenger	\$21,50	
Acura	TL	39,384	\$19,88	Passenger	\$28,40	
Acura	CL	14,114		Passenger		
Acura	RL	8,588		Passenger	\$42,00	

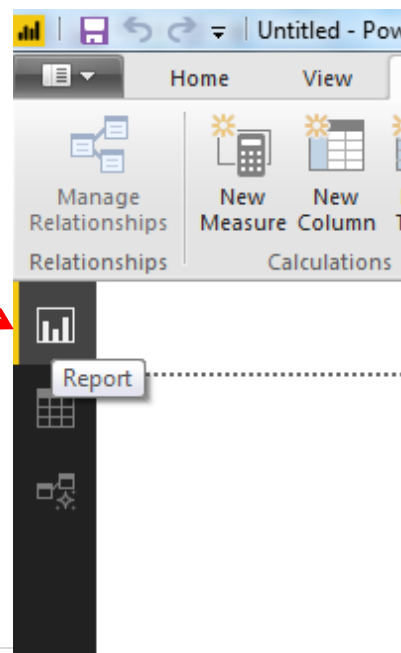

The new column with calculated value should appear as the last one in the dataset.

Task 3. Visualizing data in charts and tables

Now our task is to get some knowledge from the dataset.

Switch to the Report view.

Here we can make new tables and charts.

Task 3.1. Natural language queries

In Power BI we can ask (not very sophisticated) queries in natural language. It is useful feature that saves time.

To try this feature click on “Ask a Question”

Our aim is to get sales value achieved by each of the manufacturers.

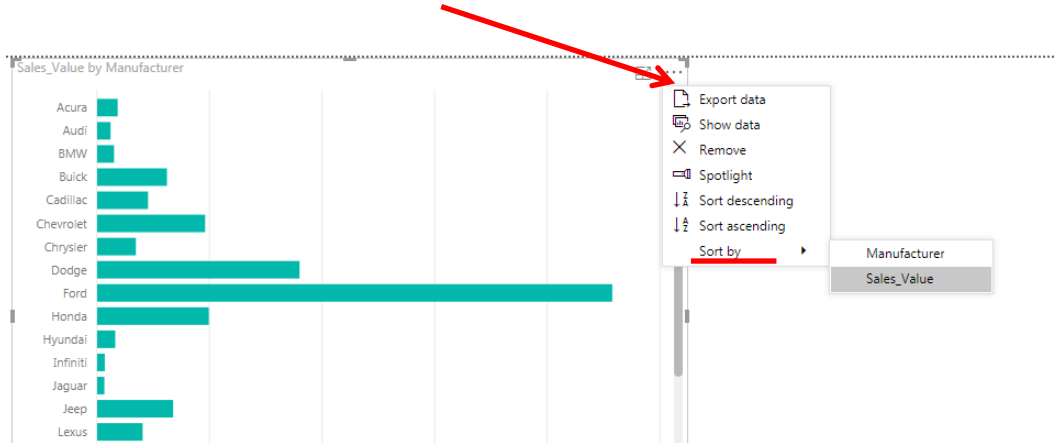

So just type: sales value by manufacturer and see the results!

Try to ask other questions in natural language, for example *Average fuel efficiency by manufacturer*

Task 3.2. Changing the layout and format

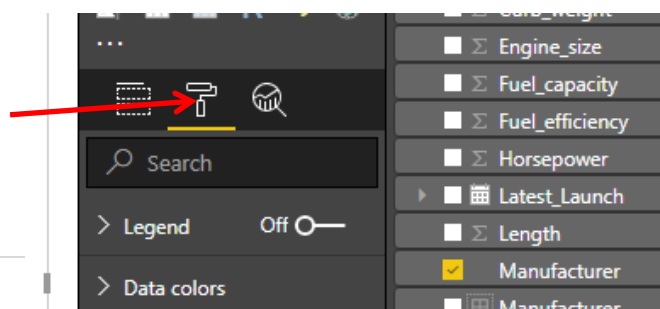

You can sort the data on the chart by sales value or manufacturer.

Try to add a pie chart to your report. Use the right side of the screen (drag&drop the fields)

You can format the chart and any element of your report (font size, color, etc.) by clicking on painting tool

Try some options, feel free to choose colors and fonts, add a legend...

Task 3.3. Adding tables and charts

We can compose our report on many pages. To add another page click on the yellow + at the bottom of the screen. You can name your new page.

To add a table to your report choose from the visualizations menu on the right.

Add a table presenting AVERAGE fuel efficiency by manufacturer. Format the table (change colors and font size, sort the data)

Add the column chart and do the formatting as well.

The screenshot shows a table with two columns: 'Manufacturer' and 'Fuel_efficiency'. The table is sorted by fuel efficiency in ascending order. A red arrow points from the text above to the table icon in the visualizations menu.

Manufacturer	Fuel_efficiency
Jaguar	21
Infiniti	25
Saab	46
Subaru	49
Jeep	56
Lincoln	58
Porsche	66
Audi	70
BMW	75
Hyundai	83
Buick	97
Acura	101

Add new page to your report. Make a line chart and table showing Prices and year resale value by car model. Do some formatting to your chart.

Sort the data on the chart by year resale value.

Use scatter chart to visualize horse power and price of cars.

Add a funnel control to the chart to change the range of variables displayed

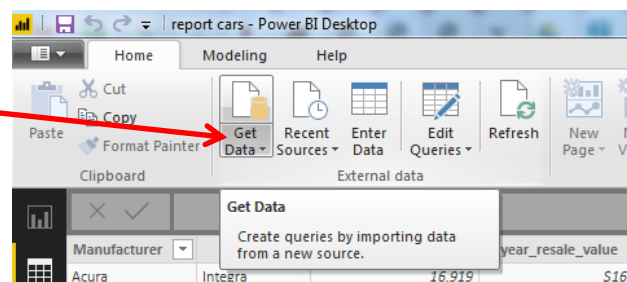

Task 4. Relationships in tables

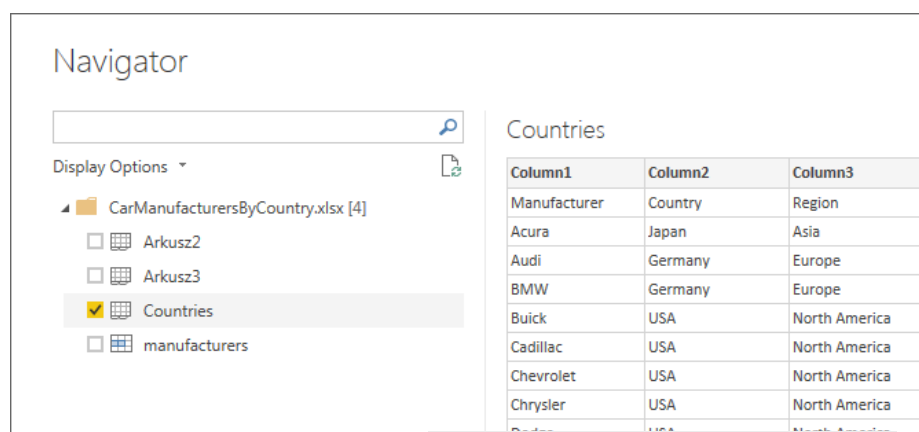

Task 4.1. Adding another table

As the name suggests, Relationship in Power BI is used to define the connections or the relation between two or more tables. The relationship is used when we want to perform an analysis based on multiple tables. Relationship helps us to display the data and correct information between multiple tables. It is used to calculate the accurate results also.

Click “Get Data” on “Home” ribbon and add to your project the excel file CarManufacturersByCountry.xlsx

In the navigator select the “Countries” spreadsheet

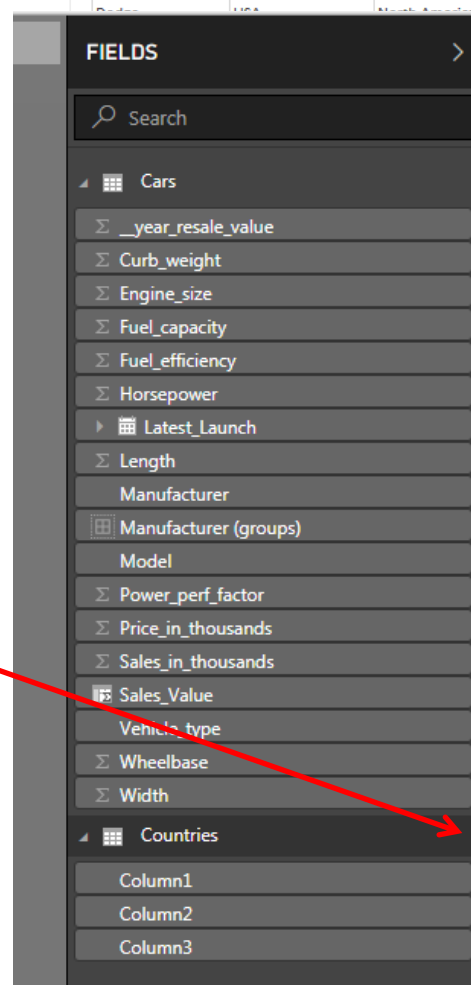

The structure of our new table appears on the right of the screen.

As you can see the fields names are Column1, Column 2 and Column3.

The fields names should be taken from the first row of the table.

To edit our new table “Countries” click on three dots icon

Then in editing mode, open the drop-down menu and select “Use the first row as headers”.

To apply changes to the table click on the button “Close and Apply”

Now go to the Relationships editor by clicking the button

As you can see the relationship between our two tables was automatically recognized by Power BI. The relationship is one to many.

Task 4.2. Adding related columns

We are going to add another column to our “Cars” table which will be the name of the Country where the manufacturer’s headquarters are located.

To do this we use DAX¹ language command “Related”

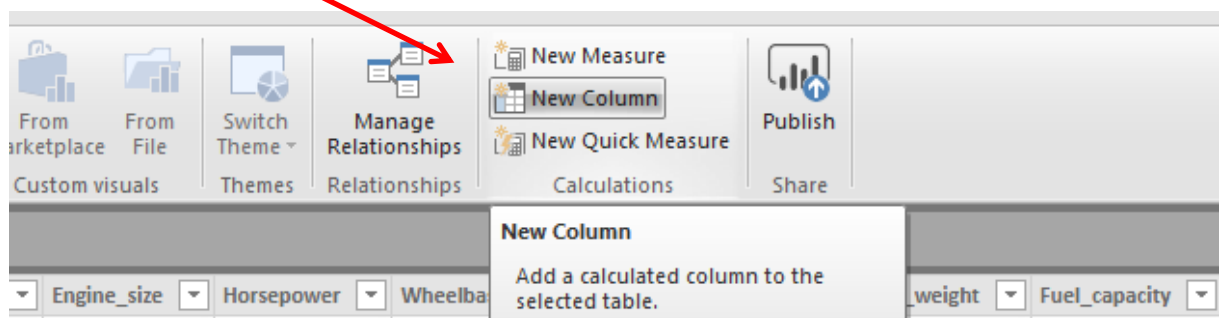

Again switch to tables view

And display the table “Cars” (choose from the Fields on the right of the screen.

The table “Cars” must be displayed because now we are going to add related column to it.

Click on “New Column” on the “Home” ribbon

¹ DAX (Data Analysis Expressions) is a formula expression language and can be used in different BI and visualization tools.

Start typing in the formula bar. Change the column name to “Country”

New column in the data set should appear as the last one, containing names of countries.

Add new column named “Region” in the same way.

Task 5. Spatial visualization

Since we have spatial data field in our dataset we can use maps for visualizations in our report.

Switch to the report view.

Choose the ArcGIS Map tool from the visualizations palette.

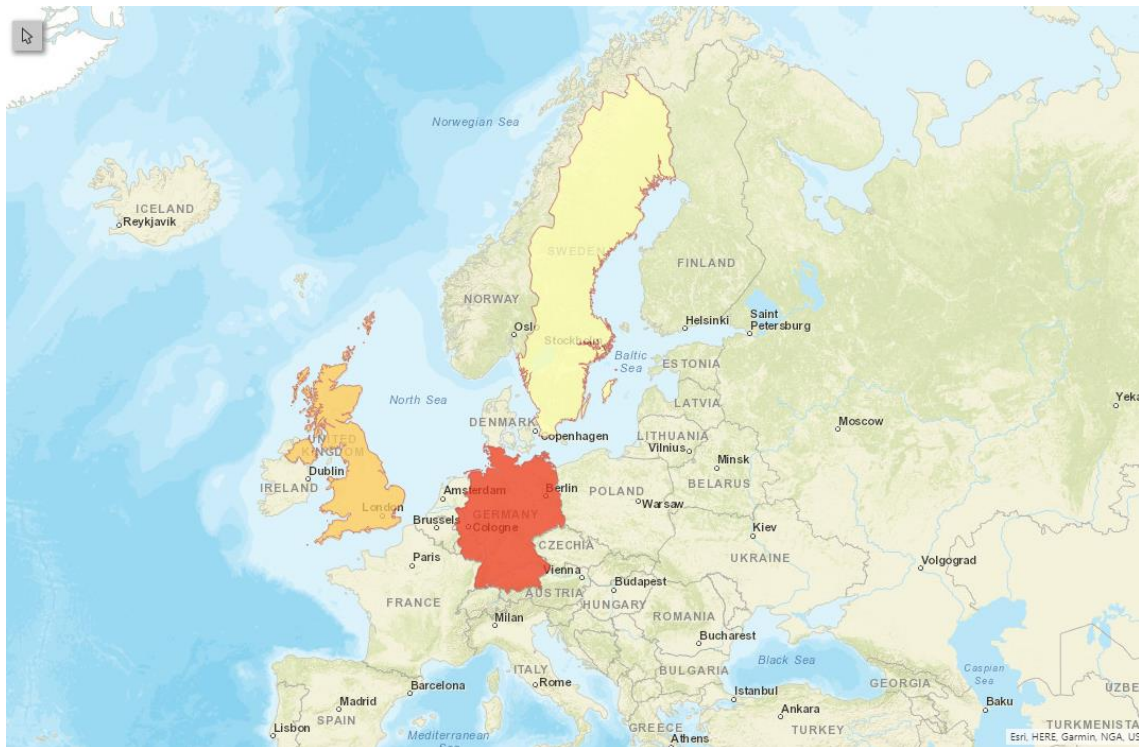

Make visualization of Sales Value by country.

Drag and drop “Country” as Location and “Sales_Value” as Color.

To change the style of the map click on three dots in the upper right corner of your map.

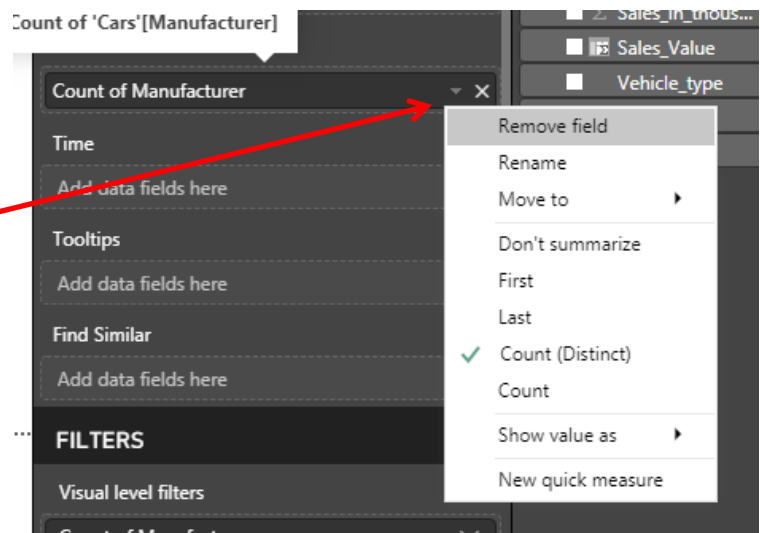

Try many different settings....

Add another map showing the number of distinct Manufacturers by Country (how many manufacturers there are in each country)

Use the dropdown menu to choose appropriate measure

After completing all of the tasks save your report as pdf and send it to the e-learning platform.
